

BOURBLES FARM, PREESALL, LANCASHIRE Geological Information

1. Introduction

A series of boreholes were drilled across the area referenced as Bourbles Farm in two phases in 2021 and 2023. Bulk samples of the sand and gravel collected during the drilling were logged and representative samples for despatch for testing at a UKAS accredited laboratory. This testing mainly comprised particle size distribution (gradings), together a range of physical tests to determine the general properties of the gravel fraction.

A summary table of the borehole results with the recorded overburden and mineral thicknesses is given at the back of this document. The drilling confirms that the sand and gravel deposit is present in a relatively narrow zone trending north-west to south-east across the district (mapped as a storm beach deposit) where the mineral has a maximum thickness of around 6m, ranging from around 1m on the margins of the deposit. The drilling also confirms that there is very little overburden covering the mineral, only soils.

The borehole drilling confirms that the deposit is formed mainly of dark grey to black igneous sub-rounded to angular pebbles, with a range of purple and reddish brown rounded vein quartz and quartzite pebbles with occasional oversize cobbles present. The sand is mainly quartz grains. A typical bulk borehole sample is shown below.

2. Particle Size Distribution- Representative Borehole Samples

A total of 24 bulk borehole samples were laboratory tested and the overall mean grading for the sand and gravel deposit is given below.

Percentage Passing (mm)

					-										
	0.063	0.125	0.25	0.50	1.0	2.0	4.0	6.3	8.0	10	14	20	25	40	80
Mean S&G Grading	3.1	5	7	39	52	57	64	68	70	73	77	84	88	94	99

The deposit is generally considered relatively clean with a mean silt content (-63micron) of only 3.1%. The mean grading for the bulk samples tested comprised some 36% gravel (+4mm). The sand fraction comprises mainly quartz and some mafic grains that comprises about 60% of the deposit. The sand fraction only is mainly medium to coarse grades with only a limited amount of fine sand present, as shown below.

Sand Fraction Only (-4mm)

	0.063	0.125	0.25	0.5	1.0	2.0	4.0
Sand Fraction Only	4.8	8	10	59	79	88	100

	Fine	Medium	Coarse		
	Sand	Sand Sand			
Fines:	(-250u)	(+250u)	(+1mm)		

3. Laboratory Test Results

In addition to the grading analyses, a number of physical and chemical tests were carried out to assess the aggregate properties of the gravel fraction, with the results given below:

Client Sample Reference	Combined Sample		
Sample Description		Brown sand and gravel	
Determinant	Units		
EN 1097 Particle Density and Water Abso	orption		
Mass of test portion	(kg)	6.2	
Size of aggregate	(mm)	4mm-31.5mm	
Apparent density	(Mg/m³)	2.66	
Particle density - oven dried	(Mg/m³)	2.64	
Particle density - saturated surface dried	(Mg/m³)	2.65	
Water absorption	(%)	0.2	
Testing in accordance with EN 1097- 6:2000		Clause 7	
Water Absorption was determined in accordance with		clause 8 (4mm to 31.5mm)	

Sample Description			Gravel
	Units	Accreditation	
Aggregate size fraction tested	(mm)	UKAS	14/10 mm
Individual Magnesium Sulphate Value 1	(%)	UKAS	3.2
Individual Magnesium Sulphate Value 2	(%)	UKAS	3.1
Magnesium Sulphate Value (MS)	(%)	UKAS	3.2

LABORATORY TEST REPORT

TEST REQUIREMENTS: To determine the Ten Per Cent Fines Value (TFV) of aggregate sample 10mm and greater in accordance with BS 812: Part 111: 1990.

SAMPLE DETAILS:	
Certificate of sampling received:	No
Laboratory Ref. No:	\$95446
Client Ref. No:	21-18728 - 169269
Date and Time of Sampling:	Unknown
Date of Receipt at Lab:	04/06/2021
Date of Start of Test:	02/07/2021
Sampling Location:	Unknown
Name of Source:	Bourbles Farm
Method of Sampling:	Unknown
Sampled By:	Client (Test results apply to sample as received)
Tested By:	OW
Material Description:	10/20mm Gravel
Target Specification:	N/A
RESULTS:	

Ten per cent fines value (SOAKED) = 300 kN

4. Assessment of Aggregate Properties

It is considered that the sand and gravel proved on the Bourbles Farm site can be processed and screened to create a range of concreting aggregates comprising sharp sand and both 10mm and 20mm gravel products. In addition, a 40mm material could also be produced (if required) for use in piling, drainage and other construction end-uses.

The initial laboratory testing of the borehole samples indicates that the gravel is suitable for use as a high-quality construction and concreting aggregate, following washing and screening to produce the required graded aggregate fractions. The coarse aggregate fraction (gravel) is considered to have the required strength and durability for use in a full range of concrete mixes. However, the final aggregate end-uses will be determined following further testing and field trials of the material.

It is considered that all saleable materials will be produced using "the markets most technologically advanced wet processing plant, resulting in consistent high specification aggregate products", as stated by the proposed plant supplier (CDE Ltd).
